## Lecture 26

Chemical Reaction Engineering (CRE) is the field that studies the rates and mechanisms of chemical reactions and the design of the reactors in which they take place.

\end{gathered}
$$

Table 14-4. Mass Transfer Correlations

Turbulent flow, mass transfer to pipe wall
Mass transfer to a single sphere
Mass transfer in fluidized beds

Mass transfer to packed beds

$$
\begin{aligned}
& \mathrm{Sh}=.332(\mathrm{Re})^{1 / 2}(\mathrm{Sc})^{1 / 3} \\
& \mathrm{Sh}=2+0.6 \mathrm{Re}^{1 / 2} \mathrm{Sc}^{1 / 3} \\
& \mathrm{Sh}=\mathrm{J}_{\mathrm{D}} \operatorname{Re~Sc} \\
& \phi \mathrm{~J}_{\mathrm{D}}=\frac{0.765}{\mathrm{Re}^{.82}}+\underline{0.365} \\
& \mathrm{Re}^{0.386}
\end{aligned} \begin{aligned}
& \mathrm{Sh}=\mathrm{J}_{\mathrm{D}} \operatorname{Re~Sc}^{1 / 2} \\
& \phi \mathrm{~J}_{\mathrm{D}}=\underline{0.453} \mathrm{Re}^{0.453}
\end{aligned}
$$

$$
\begin{gathered}
\mathrm{Sh}^{\prime}=1.0\left(\mathrm{Re}^{\prime}\right)^{1 / 2} \mathrm{Sc}^{1 / 3} \\
{\left[\frac{k_{c} d_{p}}{D_{\mathrm{AB}}}\left(\frac{\phi}{1-\phi}\right) \frac{1}{\gamma}\right]=\left[\frac{U d_{p} \rho}{\mu(1-\phi) \gamma}\right]^{1 / 2}\left(\frac{\mu}{\rho D_{\mathrm{AB}}}\right)^{1 / 3}} \\
J_{D}=\frac{\mathrm{Sh}}{\mathrm{Sc}^{1 / 3} \mathrm{Re}}
\end{gathered}
$$

$$
\begin{gathered}
\frac{\mathrm{Re}}{\phi J_{D}=\frac{0.765}{\mathrm{Re}^{0.82}}+\frac{0.365}{\mathrm{Re}^{0.386}}} \\
k_{c} \propto\left(\frac{D_{\mathrm{AB}}^{2 / 3}}{v^{1 / 6}}\right)\left(\frac{U^{1 / 2}}{d_{p}^{1 / 2}}\right)
\end{gathered}
$$

Figure 14-3 Diffusion to, and reaction on, external surface of pellet.

$$
\begin{aligned}
& -\mathrm{r}_{\mathrm{As}}^{\prime \prime}=k_{r} C_{A s} \\
& W_{A S u r a c e}=-r_{A s}^{\prime \prime}
\end{aligned}
$$

$$
W_{A}=k_{C}\left(C_{A}-C_{A s}\right)=k_{r} C_{A s}
$$

We need to eliminate $\mathrm{C}_{\mathrm{As}}$.

$$
C_{\mathrm{A} s}=\frac{k_{c} C_{\mathrm{A}}}{k_{r}+k_{c}}
$$

and the rate of reaction on the surface becomes

$$
W_{\mathrm{A}}=-r_{\mathrm{A} s}^{\prime \prime}=\frac{k_{c} k_{r} C_{\mathrm{A}}}{k_{r}+k_{c}}
$$

One will often find the flux to or from the surface as written in terms of an effective transport coefficient $k_{\text {eff }}$ :

$$
W_{A}=-r_{A s}^{\prime \prime}=k_{\mathrm{eff}} C_{A}
$$

Case 1

$$
\begin{gathered}
k_{\mathrm{eff}}=\frac{k_{c} k_{r}}{k_{c}+k_{r}} \\
k_{r}>k_{c} \\
k_{\mathrm{eff}}=k_{c}
\end{gathered}
$$

One will often find the flux to or from the surface as written in terms of an effective transport coefficient $k_{\text {eff }}$ :
where

$$
W_{A}=-r_{A s}^{\prime \prime}=k_{\mathrm{eff}} C_{A}
$$

Case 1

$$
\begin{gathered}
k_{c}=0.6\left(\frac{D_{A B}}{d_{p}}\right)\left(\frac{U d_{p}}{v}\right)^{1 / 2}\left(\frac{v}{D_{A B}}\right)^{1 / 2} \\
k_{c} \sim\left(U / d_{p}\right)^{1 / 2} \\
-r_{A s}^{\prime \prime}=k_{c} C_{A}
\end{gathered}
$$

Case 2

One will often find the flux to or from the surface as written in terms of an effective transport coefficient $k_{\text {eff }}$ :

$$
W_{A}=-r_{A S}^{\prime \prime}=k_{\mathrm{eff}} C_{A}
$$

where

$$
k_{\mathrm{eff}}=\frac{k_{c} k_{r}}{k_{c}+k_{r}}
$$

Case 1

$$
\begin{gathered}
k_{r}>k_{c} \\
k_{\mathrm{eff}}=k_{c} \\
k_{c}=0.6\left(\frac{D_{A B}}{d_{p}}\right)\left(\frac{U d_{p}}{v}\right)^{1 / 2}\left(\frac{v}{D_{A B}}\right)^{1 / 2} \\
k_{c} \sim\left(U / d_{p}\right)^{1 / 2} \\
-r_{A s}^{\prime \prime}=k_{c} C_{A} \\
k_{r}<k_{c} \\
W_{A}=-r_{A s}^{\prime \prime}=\frac{k_{r} C_{A}}{1+k_{r} / k_{c}} \approx k_{r} C_{A}
\end{gathered}
$$

Case 2

Figure 14-4 Regions of mass transfer-limited and reaction-limited reactions.

## Transdermal drug delivery schematic.

Skin Layers

$$
\begin{aligned}
& F_{A(z)}-F_{A(z+\Delta z)}+0=0 \\
& -\frac{A W_{(z+\Sigma)}-A W_{A(z)}}{\Delta z}=0
\end{aligned}
$$

Step 1. Diffusion of A through the Epidermis film, which is stagnant reduces to

$$
\frac{d W_{A z}}{d z}=0
$$

Step 2. Use Fick's law to relate the flux $\mathrm{W}_{\mathrm{Az}}$ and the concentration gradient

$$
W_{A 1}=-D_{A 1} \frac{d C_{A}}{d z}
$$

Step 3. State the boundary conditions

$$
\begin{array}{ll}
z=0 & C_{A}=C_{A 0} \\
z=\delta_{1} & C_{A}=C_{A_{\delta} 1}
\end{array}
$$

Step 4. Next substitute for $W_{\mathrm{Az}}$ and divide by $D_{\mathrm{A} 1}$ to obtain

$$
\frac{d^{2} C_{A}}{d z^{2}}=0
$$

Integrating twice

$$
C_{A}=K_{1} z+K_{2}
$$

Step 4.
Using the boundary conditions we can eliminate the constants $K_{1}$ and $K_{2}$ to obtain the concentration profile

$$
\begin{aligned}
& C_{A}=K_{1} z+K_{2} \\
& \frac{C_{A 0}-C_{A}}{C_{A 0}-C_{A}}=\frac{z}{\delta_{1}}
\end{aligned}
$$

Step 5. Substituting CA we obtain the flux in the Epidermis layer

$$
W_{A 1}=-D_{A 1} \frac{d C_{A}}{d z}=\frac{D_{A 1}}{\delta}\left[C_{A 0}-C_{A 1}\right]
$$

Step 6. Carry out a similar analysis for the Dermis layer starting with

$$
\frac{d^{2} C_{A}}{d z^{2}}=0
$$

We find

$$
z=\delta_{1} \quad C_{A}=C_{A 1}
$$

Substituting

$$
z=\delta_{2} \quad C_{A}=0
$$

Step 7.
At the interface between the Epedermis and Dermisjayer, i.e., at $z=\delta_{1}$

$$
\frac{C_{A 1}-0}{C_{A 1}-0}=\frac{Z}{\delta_{2}}
$$

$$
W_{A 2}=\frac{D_{A 2}}{\delta_{2}} C_{A 1}
$$

Substituting

$$
W_{A 2}=\frac{D_{A 2}}{\delta_{2}} C_{A 1}
$$

Step 7. At the interface between the Epedermis and Dermis layer, i.e., at $z=\delta_{1}$

$$
W_{A 1}=W_{A 2}=W_{A}
$$

Equating Equations (E14-1.5) and (E14-1.6)

$$
\frac{D_{A 1}\left[C_{A 0}-C_{A 1}\right]}{\delta_{1}}=\frac{D_{A 2}}{\delta_{2}} C_{A 1}
$$

Step 7. At the interface between the Epedermis and Dermis layer, i.e., at $z=\delta_{1}$

$$
W_{A 1}=W_{A 2}=W_{A}
$$

Equating Equations (E14-1.5) and (E14-1.6)

$$
\frac{D_{A 1}\left[C_{A 0}-C_{A 1}\right]}{\delta_{1}}=\frac{D_{A 2}}{\delta_{2}} C_{A 1}
$$

Solving for $C_{A 1}$

$$
C_{A 1}=\frac{\frac{D_{A 1}}{} \frac{C_{A 0}}{\delta_{1}}}{\frac{D_{A 1}}{\delta_{1}}+\frac{D_{A 2}}{\delta_{2}}}
$$

Step 7. At the interface between the Epedermis and Dermis layer, i.e., at $z=\delta_{1}$

$$
\begin{aligned}
& W_{A 1}=W_{A 2}=W_{A} \\
& W_{A}=\frac{D_{A 2} \mathrm{C}_{\mathrm{A} 1}}{\delta_{2}}
\end{aligned}
$$

Substituting for $C_{A 1}$ in Equation (E14-1.10)

$$
W_{A}=\frac{C_{A 0}}{\frac{\delta_{2}}{D_{A 2}}+\frac{\delta_{1}}{D_{A 1}}}=\frac{C_{A 0}}{R_{1}+R_{2}}
$$

$$
F_{A}=A_{p} W_{A}=A_{p} \frac{C_{A 0}}{R_{1}+R_{2}}=A_{p} \frac{C_{A 0}}{R}
$$

If we consider there is a resistance to the drug release in the patch, $R_{p}$, then the total resistance is

$$
\begin{gathered}
R_{T}=R_{p}+R_{1}+R_{2} \\
F_{A}=A_{p} W_{A}=\frac{A_{p} C_{A 0}}{R_{T}}
\end{gathered}
$$

If the resistance in the dermis layer is neglected

$$
F_{A}=A_{p}\left[\frac{D_{A B_{1}}}{\delta_{1}}\right] C_{A p}
$$

$$
\begin{gather*}
{\left[\begin{array}{c}
\text { Molar } \\
\text { rate in }
\end{array}\right]-\left[\begin{array}{c}
\text { Molar } \\
\text { rate out }
\end{array}\right]+\left[\begin{array}{c}
\text { Molar rate of } \\
\text { generation }
\end{array}\right]=\left[\begin{array}{c}
\text { Molar rate of } \\
\text { accumulation }
\end{array}\right]} \\
\left.F_{\mathrm{A} z}\right|_{z}-\left.F_{\mathrm{A} z}\right|_{z+\Delta z}+r_{\mathrm{A}}^{\prime \prime} a_{c}\left(A_{c} \Delta z\right)=0 \tag{14-51}
\end{gather*}
$$

Figure 14-5 Packed-bed reactor.

$$
-\frac{1}{A_{c}}\left(\frac{d F_{A z}}{d z}\right)+r_{A}^{\prime \prime} a_{c}=0
$$

$$
\begin{gathered}
-\frac{1}{A_{c}}\left(\frac{d F_{A z}}{d z}\right)+r_{A}^{\prime \prime} a_{c}=0 \\
F_{A z}=A_{c} W_{A z}=\left(J_{A z}+B_{A z}\right) A_{c} \\
=B_{A z} A_{c}=U C_{A} A_{c} \\
-\frac{U d C_{A}}{d z}+r_{A}^{\prime \prime} a_{c}=0_{c}
\end{gathered}
$$

$$

=\left(\ln \frac{1}{1-0.865}\right)\left[\frac{\frac{1}{2} L_{1}}{L_{1}}\left(\frac{U_{1}}{\frac{1}{2} U_{1}}\right)^{1 / 2}\right] \\
=2.00\left(\frac{1}{2}\right) \sqrt{2}=1.414 \\
X_{2}=0.76
\end{gathered}
$$

One will often find the flux to or from the surface as written in terms of an effective transport coefficient $k_{\text {eff }}$ :

$$
W_{\mathrm{A}}=-r_{\mathrm{A} s}^{\prime \prime}=k_{\mathrm{eff}} C_{\mathrm{A}}
$$

where

$$
\begin{gathered}
k_{\mathrm{eff}}=\frac{k_{c} k_{r}}{k_{c}+k_{r}} \\
\mathrm{Sh}=\frac{k_{c} d_{p}}{D_{\mathrm{AB}}}=2+0.6 \mathrm{Re}^{1 / 2} \mathrm{Sc}^{1 / 3} \\
k_{c}=0.6\left(\frac{D_{\mathrm{AB}}}{d_{p}}\right) \mathrm{Re}^{1 / 2} \mathrm{Sc}^{1 / 3} \\
=0.6\left(\frac{D_{\mathrm{AB}}}{d_{p}}\right)\left(\frac{U d_{p}}{v}\right)^{1 / 2}\left(\frac{v}{D_{\mathrm{AB}}}\right)^{1 / 3} \\
k_{c}=0.6 \times \frac{D_{\mathrm{AB}}^{2 / 3}}{v^{1 / 6}} \times \frac{U^{1 / 2}}{d_{p}^{1 / 2}} \\
k_{c}=0.6 \times(\mathrm{Term} 1) \times(\mathrm{Term} 2) \\
\left(U_{2} / U_{1}\right)^{0.5}=2^{0.5}=1.41 \text { or } 41 \% \\
k_{r} \ll k_{c}
\end{gathered}
$$

$$
W_{\mathrm{A}}=-r_{\mathrm{A} s}^{\prime \prime}=\frac{k_{r} C_{\mathrm{A}}}{1+k_{r} / k_{c}} \approx k_{r} C_{\mathrm{A}}
$$

$$
\begin{gathered}
\left.F_{A}\right|_{z}=\left.F_{A}\right|_{z+\Delta z}+r_{A} A_{c} \Delta z=0 \\
\frac{d F_{A}}{d z}+r_{A} A_{c}=0 \\
F_{A z}=A_{c} W_{A z} \\
W_{A z}=-D_{A B} \frac{d C_{A}}{d z}+C_{A} U_{z} \\
F_{A z}=W_{A z} A_{c}=\left[-D_{A B} \frac{d C_{A}}{d z}+C_{A} U_{z}\right] A_{c} \\
\left.D_{A B} \frac{d^{2} C_{A}}{d z^{2}}-U_{z} \frac{d C_{A}}{d z}+r_{A}=0\right]
\end{gathered}
$$

Step 4. Next substitute for $W_{\mathrm{Az}}$ and divide by $D_{\mathrm{A} 1}$ to obtain

$$
\frac{d^{2} C_{A}}{d z^{2}}=0
$$

Integrating twice

$$
C_{A}=K_{1} z+K_{2}
$$

using the boundary conditions we can eliminate the constants $K_{1}$ and $K_{2}$ to obtain the concentration profile

$$
\frac{C_{A 0}-C_{A}}{C_{A 0}-C_{A}}=\frac{z}{\delta_{1}}
$$

Step 5. Substituting CA we obtain the flux in the Epidermis layer

$$
W_{A 1}=-D_{A 1} \frac{d C_{A}}{d z}=\frac{D_{A 1}}{\delta}\left[C_{A 0}-C_{A 1}\right]
$$

1. Specify a concentration at a boundary (e.g., $\mathbf{z}=0, C_{\mathrm{A}}=C_{\mathrm{A} 0}$ ). For an instantaneous reaction at a boundary, the concentration of the reactants at the boundary is taken to be zero (e.g., $C_{\mathrm{A} s}=0$ ). See Chapter 18 for the more exact and complicated Danckwerts' boundary conditions at $\mathbf{z}=0$ and $\mathbf{z}=\mathrm{L}$.
2. Specify a flux at a boundary.
a. No mass transfer to a boundary,

$$
\begin{equation*}
W_{\mathrm{A}}=0 \tag{14-18}
\end{equation*}
$$

For example, at the wall of a nonreacting pipe. Species A cannot diffuse into the pipe so $\mathrm{W}_{\mathrm{A}}=0$ and then

$$
\begin{equation*}
\frac{d C_{\mathrm{A}}}{d r}=0 \quad \text { at } r=R \tag{14-19}
\end{equation*}
$$

That is, because the diffusivity is finite, the only way the flux can be zero is if the concentration gradient is zero.
b. Set the molar flux to the surface equal to the rate of reaction on the surface,

$$
\begin{equation*}
W_{\mathrm{A}}(\text { surface })=-r_{\mathrm{A}}^{\prime \prime}(\text { surface }) \tag{14-20}
\end{equation*}
$$

c. Set the molar flux to the boundary equal to convective transport across a boundary layer,

$$
\begin{equation*}
W_{\mathrm{A}}(\text { boundary })=k_{c}\left(C_{\mathrm{A} b}-C_{\mathrm{A} s}\right) \tag{14-21}
\end{equation*}
$$

where $k_{c}$ is the mass transfer coefficient and $C_{\mathrm{A} s}$ and $C_{\mathrm{A} b}$ are the surface and bulk concentrations, respectively.
3. Planes of symmetry. When the concentration profile is symmetrical about a plane, the concentration gradient is zero in that plane of symmetry. For example, in the case of radial diffusion in a pipe, at the center of the pipe

$$
\begin{equation*}
\frac{d C_{\mathrm{A}}}{d r}=0 \quad \text { at } r=0 \tag{14-22}
\end{equation*}
$$
