## Review: Nonideal Flow in a CSTR

- Ideal CSTR: uniform reactant concentration throughout the vessel
- Real stirred tank
- Relatively high reactant concentration at the feed entrance
- Relatively low concentration in the stagnant regions, called dead zones (usually corners and behind baffles)

## Review: Nonideal Flow in a PBR

- Ideal plug flow reactor: all reactant and product molecules at any given axial position move at same rate in the direction of the bulk fluid flow
- Real plug flow reactor: fluid velocity profiles, turbulent mixing, \& molecular diffusion cause molecules to move with changing speeds and in different directions

## Review: Residence Time Distribution

RTD $\equiv \mathrm{E}(\mathrm{t}) \equiv$ "residence time distribution" function
RTD describes the amount of time molecules have spent in the reactor RTD is experimentally determined by injecting an inert "tracer" at $t=0$ and measuring the tracer concentration $\mathrm{C}(\mathrm{t})$ at exit as a function of time

$$
\operatorname{RTD}=\mathrm{E}(\mathrm{t})=\frac{\mathrm{C}(\mathrm{t})}{\int_{0}^{\infty} \mathrm{C}(\mathrm{t}) \mathrm{dt}}=\frac{\text { tracer conc at exit between } \mathrm{t} \& \mathrm{t}+\Delta \mathrm{t}}{\text { sum of tracer conc at exit for infinite time }}
$$

$$
\begin{array}{ll}
\int_{0}^{\infty} E(t) d t=1 & E(t)=0 \text { for } t<0 \text { since no tracer can exit before it enters } \\
E(t) \geq 0 \text { for } t>0 \text { since mass fractions are always positive }
\end{array}
$$

Fraction of material leaving reactor that has
been inside reactor for a time between $t_{1} \& t_{2}$ $\int_{t_{1}}^{t_{2}} E(t) d t$

A pulse of tracer was injected into a reactor, and the effluent concentration as a function of time is in the graph below. Construct a figure of $C(t) \& E(t)$ and calculate the fraction of material that spent between $3 \& 6 \mathrm{~min}$ in the reactor

| t |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| min | 0

Plot C vs time:

To tabulate $\mathrm{E}(\mathrm{t})$ : divide $\mathrm{C}(\mathrm{t})$ by the total area under the $\mathrm{C}(\mathrm{t})$ curve, which must be numerically evaluated as shown below:

$$
\int_{0}^{\infty} \mathrm{C}(\mathrm{t}) \mathrm{dt}=\int_{0}^{10} \mathrm{C}(\mathrm{t}) \mathrm{dt}+\int_{10}^{14} \mathrm{C}(\mathrm{t}) \mathrm{dt}
$$

$$
\int_{X_{0}}^{x_{N}} f(x) d x=\frac{\Delta t}{3}\left(f_{0}+4 f_{1}+2 f_{2}+4 f_{3}+2 f_{4} \ldots+4 f_{N-1}+f_{N}\right)
$$

$$
\int_{x_{0}}^{x_{2}} f(x) d x=\frac{\Delta t}{3}\left(f_{0}+4 f_{1}+f_{2}\right)
$$

$$
\rightarrow \rightarrow \int_{0}^{\infty} \mathrm{C}(\mathrm{t}) \mathrm{dt}=47.4 \frac{\mathrm{~g} \cdot \mathrm{~min}}{\mathrm{~m}^{3}}+2.6 \frac{\mathrm{~g} \cdot \mathrm{~min}}{\mathrm{~m}^{3}}=50 \frac{\mathrm{~g} \cdot \mathrm{~min}}{\mathrm{~m}^{3}}
$$

Review: RTD Profiles \& Cum RTD Function $\mathrm{F}(\mathrm{t})$

Nearly ideal PFR

Nearly ideal CSTR
$E(t)$

CSTR with dead zones

$$
F(t)=\int_{0}^{t} E(t) d t
$$

$F(t)=$ fraction of effluent in the reactor less for than time $t$
$F(t)=0$ when $t<0$

$$
F(t)=0 \text { when } t<0
$$

$$
F(t) \geq 0 \text { when } t \geq 0
$$

$F(t) \geq 0$ when $t \geq 0$
$F(\infty)=1$

$$
F(\infty)=1
$$

$$
1-F(t)=\int_{t}^{\infty} E(t) d t
$$

## Review: Relationship between E \& F

$F(t)=$ fraction of effluent that has been in the reactor for less than time $t$

$E(t)=$ Fraction of material leaving reactor that was inside for a time between $t_{1} \& t_{2}$ Slides courtesy of Prof M L Kraft, Chemical \& Biomolecular Engr Dept, University of Illinois at Urbana-Champaign.

## Review: Mean Residence Time, $\mathrm{t}_{\mathrm{m}}$

- For an ideal reactor, the space time $\tau$ is defined as $\mathrm{V} / v_{0}$
- The mean residence time $t_{m}$ is equal to $\tau$ in either ideal or nonideal reactors

$$
\mathrm{t}_{\mathrm{m}}=\frac{\int_{0}^{\infty} \mathrm{tE}(\mathrm{t}) \mathrm{dt}}{\int_{0}^{\infty} \mathrm{E}(\mathrm{t}) \mathrm{dt}}=\int_{0}^{\infty} \mathrm{tE}(\mathrm{t}) \mathrm{dt}=\tau \quad \frac{\mathrm{V}}{v_{0}}=\tau=\mathrm{t}_{\mathrm{m}}
$$

By calculating $\mathrm{t}_{\mathrm{m}}$, the reactor V can be determined from a tracer experiment
The spread of the distribution (variance): $\quad \sigma^{2}=\int_{0}^{\infty}\left(\mathrm{t}-\mathrm{t}_{\mathrm{m}}\right)^{2} \mathrm{E}(\mathrm{t}) \mathrm{dt}$
Space time $\tau$ and mean residence time $t_{m}$ would be equal if the following two conditions are satisfied:

- No density change
- No backmixing

In practical reactors the above two may not be valid, hence there will be a difference between them

## Significance of Mixing

-RTD provides information on how long material has been in the reactor
-RTD does not provide information about the exchange of matter within the reactor (i.e., mixing)!
-For a $1^{\text {st }}$ order reaction: $\quad \frac{\mathrm{dX}}{\mathrm{dt}}=\mathrm{k}(1-\mathrm{X})$

- Concentration does not affect the rate of conversion, so RTD is sufficient to predict conversion
-But concentration does affect conversion in higher order reactions, so we need to know the degree of mixing in the reactor
- Macromixing: produces a distribution of residence times without specifying how molecules of different age encounter each other and are distributed inside of the reactor
- Micromixing: describes how molecules of different residence time encounter each other in the reactor

## Quality of Mixing

-RTDs alone are not sufficient to determine reactor performance
-Quality of mixing is also required
Goal: use RTD and micromixing models to predict conversion in real reactors

## 2 Extremes of Fluid Mixing

Maximum mixedness: molecules are
free to move anywhere, like a microfluid. This is the extreme case of early mixing

Gases and ordinary not very viscous
liquids

Slides courtesy of Prof M L Kraft, Chemical \& Biomolecular Engr Dept, University of Illinois at Urbana-Champaign.

## Quality of Mixing

-RTDs alone are not sufficient to determine reactor performance
-Quality of mixing is also required
Goal: use RTD and micromixing models to predict conversion in real reactors

## 2 Extremes of Fluid Mixing

Maximum mixedness: molecules are free to move anywhere, like a microfluid. This is the extreme case of early mixing

Complete segregation: molecules of a given age do not mix with other globules. This is the extreme case of late mixing

Noncoalescing droplets
Solid particles
Very viscous liquids

## Complete Segregation Model

Mixing of different 'age groups' at the last possible moment

- Flow is visualized in the form of globules
- Each globule consists of molecules of the same residence time
- Different globules have different residence times
- No interaction/mixing between different globules

The mean conversion is the average conversion of the various globules in the exit stream:

$$
\mathrm{X}_{\mathrm{A}}=\sum \mathrm{X}_{\mathrm{A}}\left(\mathrm{t}_{\mathrm{j}}, \mathrm{E}\left(\mathrm{t}_{\mathrm{j}}\right) \Delta \mathrm{t}\right.
$$

Conversion achieved after spending time $t_{j}$ in the reactor

$$
\xrightarrow{\Delta t \rightarrow 0} \bar{X}_{A}=\int_{0}^{\infty} X_{A}(t) E(t) d t
$$

Fraction of globules that spend between $t_{j}$ and $t_{j}+\Delta t$ in the reactor
$X_{A}(t)$ is from the batch reactor design equation

## Complete Segregation Example

First order reaction, $\mathrm{A} \rightarrow$ Products
Batch reactor design equation:

$$
\mathrm{N}_{\mathrm{A} 0} \frac{\mathrm{dX}}{\mathrm{~A}} \mathrm{dt}=-\mathrm{r}_{\mathrm{A}} \mathrm{~V} \quad \rightarrow \mathrm{~N}_{\mathrm{A} 0} \frac{\mathrm{dX}}{\mathrm{~A}} \mathrm{dt}=\mathrm{kC}_{\mathrm{A}} \mathrm{~V}
$$

$$
\rightarrow \mathrm{N}_{\mathrm{AO}} \frac{\mathrm{dX}}{\mathrm{~A}} \mathrm{dt}=\mathrm{kC}_{\mathrm{A} O}\left(1-\mathrm{X}_{\mathrm{A}}\right) \mathrm{V} \quad \rightarrow \mathrm{~N}_{\mathrm{A} O} \frac{\mathrm{dX}}{\mathrm{~A}} \mathrm{dt}=\mathrm{kN} \mathrm{~N}_{\mathrm{A} O}\left(1-\mathrm{X}_{\mathrm{A}}\right)
$$

$$
\rightarrow \frac{d X_{A}}{d t}=k\left(1-X_{A}\right) \quad \rightarrow X_{A}(t)=1-e^{-k t}
$$

To compute conversion for a reaction with a $1^{\text {st }}$ order rxn and complete segregation, insert $E(t)$ from tracer experiment and $X_{A}(t)$ from batch reactor design equation into:

$$
\bar{X}_{A}=\int_{0}^{\infty} X_{A}(t) E(t) d t \quad \& \text { integrate }
$$

## Maximum Mixedness Model

In a PFR: as soon as the fluid enters the reactor, it is completely mixed radially with the other fluid already in the reactor. Like a PFR with side entrances, where each entrance port creates a new residence time:

$\lambda$ : time it takes for fluid to move from a particular point to end of the reactor $v(\lambda)$ : volumetric flow rate at $\lambda,=$ flow that entered at $\lambda+\Delta \lambda$ plus what entered through the sides
$v_{0} \mathrm{E}(\lambda) \Delta \lambda$ : Volumetric flow rate of fluid fed into side ports of reactor in interval between $\lambda+\Delta \lambda \& \lambda$
Volumetric flow rate of fluid fed to reactor at $\lambda: v(\lambda)=v_{0} \int_{\lambda}^{\infty} \mathrm{E}(\lambda) \mathrm{d} \lambda=v_{0}[1-\mathrm{F}(\lambda)]$ fraction of effluent in reactor for less than time t
Volume of fluid with life expectancy between $\lambda+\Delta \lambda \& \lambda: \Delta \mathrm{V}=v_{0}[1-\mathrm{F}(\lambda)] \Delta \lambda$ Slides courtesy of Prof M L Kraft, Chemical \& Biomolecular Engr Dept, University of Illinois at Urbana-Champaign.

## Maximum Mixedness \& Polymath

Mole balance on A gives:

$$
\frac{d X_{A}}{d \lambda}=\frac{r_{A}}{C_{A 0}}+\frac{E(\lambda)}{1-F(\lambda)} X_{A}
$$

-E(t) must be specified fraction of effluent in reactor for less than time $t$

- Often it is an expression that fits the experimental data
- 2 curves, one on the increasing side, and a second for the decreasing side
- Use the IF function to specify which E is used when

See section 13.8 in book

Also need to replace $\lambda$ because Polymath cannot calculate as $\lambda$ gets smaller $z=\bar{T}-\lambda$ where $\bar{T}$ is the longest time measured

$$
\frac{d X_{A}}{d z}=-\frac{r_{A}}{C_{A 0}}-\frac{E(\bar{T}-z)}{1-F(\bar{T}-z)} X_{A} \quad \begin{aligned}
& \text { Note that the sign on } \\
& \text { each term changes }
\end{aligned}
$$

Slides courtesy of Prof M L Kraft, Chemical \& Biomolecular Engr Dept, University of Illinois at Urbana-Champaign.

## Review: Nonideal Flow \& Reactor

## Real CSTRs

- Relatively high reactant conc at entrance
- Relatively low conc in stagnant regions, called dead zones
(corners \& behind baffles)

- fluid velocity profiles, turbulent mixing, \& molecular diffusion cause molecules to move at varying speeds \& directions

Goal: mathematically describe non-ideal flow and solve design problems for reactors with nonideal flow

## Resideñcep=Time Distribution.(RTD)

RTD describes the amount of time molecules have spent in the reactor RTD is experimentally determined by injecting an inert "tracer" at $t=0$ and measuring the tracer concentration $\mathrm{C}(\mathrm{t})$ at exit as a function of time

$$
E(t)=\frac{C(t)}{\int_{0}^{\infty} C(t) d t}=\frac{\text { tracer conc at exit between } t \& t+\Delta t}{\text { sum of tracer conc at exit for infinite time }}
$$

$$
\begin{array}{ll}
\int_{0}^{\infty} E(t) d t=1 & E(t)=0 \text { for } t<0 \text { since no fluid can exit before it enters } \\
E(t) \geq 0 \text { for } t>0 \text { since mass fractions are always positive }
\end{array}
$$

$\begin{aligned} & \text { Fraction of material leaving reactor that has } \\ & \text { been inside reactor for a time between } t_{1} \& t_{2}\end{aligned}=\int_{t_{1}}^{t_{2}} E(t) d t$

The fraction of the exit stream that has resided in the reactor for a period of time shorter than a given value $t$ :
$F(t)$ is a cumulative distribution function

$$
\begin{aligned}
& \int_{0}^{\mathrm{t}} \mathrm{E}(\mathrm{t}) \mathrm{dt}=\mathrm{F}(\mathrm{t}) \\
& \int_{\mathrm{t}}^{\infty} \mathrm{E}(\mathrm{t}) \mathrm{dt}=1-\mathrm{F}(\mathrm{t}) \\
& \mathrm{F}(\mathrm{t})=0 \text { when } \mathrm{t}<0 \\
& \mathrm{~F}(\mathrm{t}) \geq 0 \text { when } \mathrm{t} \geq 0 \\
& \mathrm{~F}(\infty)=1
\end{aligned}
$$

$80 \%$ of the molecules spend 40 min or less in the reactor

## Review: Mean Residence Time, $\mathrm{t}_{\mathrm{m}}$

- For an ideal reactor, the space time $\tau$ is defined as $V / v_{0}$
- The mean residence time $t_{m}$ is equal to $\tau$ in either ideal or nonideal reactors

$$
\mathrm{t}_{\mathrm{m}}=\frac{\int_{0}^{\infty} \mathrm{tE}(\mathrm{t}) \mathrm{dt}}{\int_{0}^{\infty} \mathrm{E}(\mathrm{t}) \mathrm{dt}}=\int_{0}^{\infty} \mathrm{tE}(\mathrm{t}) \mathrm{dt}=\tau \quad \frac{\mathrm{V}}{v_{0}}=\tau=\mathrm{t}_{\mathrm{m}}
$$

By calculating $\mathrm{t}_{\mathrm{m}}$, the reactor V can be determined from a tracer experiment
The spread of the distribution (variance): $\quad \sigma^{2}=\int_{0}^{\infty}\left(\mathrm{t}-\mathrm{t}_{\mathrm{m}}\right)^{2} \mathrm{E}(\mathrm{t}) \mathrm{dt}$
Space time $\tau$ and mean residence time $t_{m}$ would be equal if the following two conditions are satisfied:

- No density change
- No backmixing

In practical reactors the above two may not be valid, hence there will be a difference between them

## Review: Complete Segregation

Segregation model: $X_{A}=\int_{0}^{\infty} X_{A}(t) E(t) d t X_{A}(t)$ is from batch reactor design eq

## Numerical method

1. Solve batch reactor design equation to determine eq for $X_{A}$
2. Determine $X_{A}$ for each time
3. Use numerical methods to determine $\bar{X}_{A}$

## Polymath Method

1. Use batch reactor design equation to find eq for $X_{A}$
2. Use Polymath polynomial curve fitting to find equation for $E(t)$
3. Use Polymath to determine $\bar{X}_{A}$

Alternative approach: segregation model by Polymath:

$$
X_{A}=\int_{0}^{\infty} X_{A}(t) E(t) d t
$$

Need an equation for $E(t)$

$$
X_{A}=1-\sqrt{\frac{1}{1+2 \mathrm{kC}_{\mathrm{BO}}{ }^{2} \mathrm{t}}}
$$

$$
\mathrm{k}=176
$$

$$
C_{B 0}=0.0313
$$

Use Polymath to fit the $E(t)$ vs $t$ data in the table to a polynomial Slides courtesy of Prof M L Kraft, Chemical \& Biomolecular Engr Dept, University of Illinois at Urbana-Champaign.

For the irreversible, liquidphase, nonelementary rxn $A$

$$
+B \rightarrow C+D, \quad-r_{A}=k C_{A} C_{B}^{2}
$$

Calculate the $X_{A}$ using the complete segregation model using Polymath

Model: C02 $=\mathrm{a} 1^{*} \mathrm{C} 01+\mathrm{a} 2^{*} \mathrm{C} 01^{\wedge} 2+\mathrm{a} 3^{*} \mathrm{C} 01^{\wedge} 3+\mathrm{a} 4^{*} \mathrm{C} 01^{\wedge} 4$

$$
\begin{aligned}
& \mathrm{a} 1=0.0889237 \\
& \mathrm{a} 2=-0.0157181 \\
& \text { a3 }=0.0007926 \\
& \text { a4 }=-8.63 \mathrm{E}-06
\end{aligned}
$$

Final Equation: $\mathrm{E}=0.0889237^{*} \mathrm{t}-0.0157181^{*} \mathrm{t}^{2}+0.0007926^{\star} t^{3}-8.63 \mathrm{E}-6^{*} \mathrm{t}^{4}$

| C g/ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $\mathrm{m}^{3}$ |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 Maximum mixedness model: $\frac{\mathrm{CX}_{\mathrm{A}}}{\mathrm{d} \lambda}=\frac{\mathrm{r}_{\mathrm{A}}}{\mathrm{C}_{\mathrm{A} 0}}+\frac{\mathrm{E}(\lambda)}{1-\mathrm{F}(\lambda)} \mathrm{X}_{\mathrm{A}} \quad \lambda=$ time $\quad \frac{\mathrm{dF}}{\mathrm{d} \lambda}=\mathrm{E}$ $F(\lambda)$ is a cumulative distribution function

$$
-\mathrm{r}_{\mathrm{A}}=\mathrm{kC} \mathrm{~A}_{\mathrm{A} O} \mathrm{C}_{\mathrm{B} 0}{ }^{2}\left(1-\mathrm{X}_{\mathrm{A}}\right)^{3} \quad \mathrm{C}_{\mathrm{A} 0}=\mathrm{C}_{\mathrm{B} 0}=0.0313 \mathrm{~mol} / \mathrm{L} \quad \mathrm{k}=176 \frac{\mathrm{~L}^{2}}{\mathrm{~mol}^{2} \cdot \mathrm{~min}}
$$

Polymath cannot solve because $\lambda \rightarrow 0$ (needs to increase)
Substitute $\lambda$ for $z$, where $z=\bar{T}-\lambda$ where $\bar{T}=$ longest time interval ( 14 min )
$\frac{d X_{A}}{d z}=-\left(\frac{r_{A}}{C_{A 0}}+\frac{E(T-z)}{1-F(\bar{T}-z)} X_{A}\right)$

E must be in terms of T-z. Since $\overline{T-z}=\lambda \& \lambda=\mathrm{t}$, simply substitute $\lambda$ for $t$

$$
E(\lambda)=0.0889237^{*} \lambda-0.0157181^{*} \lambda^{2}+0.0007926^{*} \lambda^{3}-8.63 E-6^{\star} \lambda^{4}
$$

The following slides show how the same problem would be solved and the solutions would differ if the reaction rate was still $-r_{A}=k C_{A} C_{B}{ }^{2}$ but the reaction was instead elementary: $\mathrm{A}+\underline{2 \mathrm{~B}} \rightarrow \mathrm{C}+\mathrm{D}$

These slides may be provided as an extra example problem that the students may study on there own if time does not permit doing it in class.

For a pulse tracer expt, the effluent concentration $C(t) \& R T D$ function $E(t)$ are given in the table below. The irreversible, liquid-phase, elementary $\mathrm{rxn} \mathrm{A}+\underline{2 \mathrm{~B}} \rightarrow \mathrm{C}+\mathrm{D}$, $-r_{A}=k C_{A} C_{B}{ }^{2}$ will be carried out isothermally at 320 K in this reactor. Calculate the conversion for an ideal PFR, the complete segregation model and maximum mixedness model. $\mathrm{C}_{\mathrm{A} 0}=\mathrm{C}_{\mathrm{B} 0}=0.0313 \mathrm{~mol} / \mathrm{L} \& \mathrm{k}=176 \mathrm{~L}^{2} / \mathrm{mol}^{2} \cdot \mathrm{~min}$ at 320 K

How do we For an ideal reactor, $\tau=t_{m}$

$$
\mathrm{t}_{\mathrm{m}}=\int_{0}^{\infty} \mathrm{tE}(\mathrm{t}) \mathrm{dt}
$$

Use numerical method to determine $\mathrm{t}_{\mathrm{m}}$ :

$$
\mathrm{t}_{\mathrm{m}}=\int_{0}^{\infty} \mathrm{tE}(\mathrm{t}) \mathrm{dt}=\int_{0}^{10} \mathrm{tE}(\mathrm{t}) \mathrm{dt}+\int_{10}^{14} \mathrm{tE}(\mathrm{t}) \mathrm{dt}
$$

$$
\int_{0}^{10} \mathrm{tE}(\mathrm{t}) \mathrm{dt}=\frac{1}{3}\left[\begin{array}{l}
0+4(0.02)+2(0.2)+4(0.48)+2(0.8)+4(0.8) \\
+2(0.72)+4(0.56)+2(0.48)+4(0.396)+0.3
\end{array}\right]=4.57
$$

$$
\int_{10}^{14} \mathrm{tE}(\mathrm{t}) \mathrm{dt}=\frac{2}{3}[0.3+4(0.144)+0]=0.584 \rightarrow \mathrm{t}_{\mathrm{m}}=4.57+0.584=5.15 \mathrm{~min}
$$

8. $\operatorname{ex} \mathrm{x}$ ㄷ.6 $6^{*+4}{ }^{4} k$ as function of T :

$$
\mathrm{k}(\mathrm{~T})=176 \frac{\mathrm{~L}^{2}}{\mathrm{~mol}^{2} \cdot \min } \exp \left[3600 \mathrm{~K}\left(\frac{1}{320 \mathrm{~K}}-\frac{1}{\mathrm{~T}}\right)\right]
$$

Need equations from energy balance. For adiabatic operation:

$$
T=\frac{\left[-\Delta H_{R X}^{o}\left(T_{R}\right)\right] X_{A}+\sum_{i=1}^{n} \Theta_{i} C_{p_{i}} T_{0}+X_{A} \Delta C_{P} T_{R}}{\left[\sum_{i=1}^{n} \Theta_{i} C_{p_{i}}+X_{A} \Delta C_{P}\right]}
$$

For a pulse tracer expt, $C(t) \& E(t)$ are given in the table below. The irreversible, liquidphase, elementary $r \times n \mathrm{~A}+\underline{2 \mathrm{~B}} \rightarrow \mathrm{C}+\mathrm{D},-\mathrm{r}_{\mathrm{A}}=\mathrm{k} \mathrm{C}_{A} \mathrm{C}_{B}{ }^{2}$ will be carried out in this reactor. Calculate the conversion for the complete segregation model under adiabatic conditions with $\mathrm{T}_{0}=288 \mathrm{~K}, \mathrm{C}_{\mathrm{A} 0}=\mathrm{C}_{\mathrm{B} 0}=0.0313 \mathrm{~mol} / \mathrm{L}, \mathrm{k}=176 \mathrm{~L}^{2} / \mathrm{mol}^{2} \cdot \mathrm{~min}$ at $320 \mathrm{~K}, \Delta \mathrm{H}^{\circ}{ }_{\mathrm{RX}}=-40000 \mathrm{cal} /$ $\mathrm{mol}, \mathrm{E} / \mathrm{R}=3600 \mathrm{~K}, \mathrm{C}_{\mathrm{PA}}=\mathrm{C}_{\mathrm{PB}}=20 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K} \& \mathrm{C}_{\mathrm{PC}}=\mathrm{C}_{\mathrm{PD}}=30 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K}$
