

Quantum Mechanics and Atomic Physics

Vol. 1: The First Dimensions

Jens Zorn

University of Michigan P-453, Fall 2001 issue

Table Of Contents

A. INTRODUCTION

0 PREFACE

- 0.1 Objectives & Prerequisites
- 0.2 Useful References

1 INTRODUCTION AND OVERVIEW

- 1.1 Overview
- 1.2 Experiments and Paradigms
- 1.3 Experiments Challenge Classical Atomic Theory
- 1.4 What is Quantum Mechanics?
- 1.5 Quantum Mechanics and Electromagnetic Theory
- 1.6 Limits to Quantum Mechanics

2 THEORIES, MODELS, AND OBSERVABLES

- 2.1 The Role of Physical Theory
- 2.2 Models and Abstractions
- 2.3 Models as Representations

B. INTERFERENCE: A BASIC QUANTUM EFFECT

3. PREDICTION AND OBSERVATION OF EVENTS

- 3.1 Nature of Measurement in Weak Flux Limit
- 3.2 Indistinguishable Events
- 3.3 Paths to a Given Event
- 3.4 Analysis of Interference Experiments
- 3.5 Two-Slit and N-Slit Diffraction: Which Way?
- 3.6 Is there a Wave Particle Duality?
- 3.7 Building a Quantum Theory of Light and Matter

4 FUNCTIONAL DESCRIPTION OF INTERFERENCE EXPERIMENTS

- 4.1 E^2 as a Measure of Photon Density
- 4.2 The Electric Field as a Photon Probability Amplitude
- 4.3 Phases are All-Important
- 4.4 Extension of Formalism to More Than Two Coherent Sources
- 4.5 Fields with Both Coherent and Incoherent Contributions
- 4.6 When Are Interference Effects Noticeable?
- 4.7 The Quantum Description of Particles

5 [Expansion Section (not used in this printing of notes)]**C. INTERPRETING EXPERIMENTS****6 PROBES AND PATTERNS**

6.1 Spectroscopy and Scattering as Probes of Matter

Elastic Processes, Inelastic Processes

Apparatus for Spectroscopy and for Scattering

6.2 How do we obtain Spectral Lines?

6.3 What can we Learn from a Spectral Line?

Intensity, Frequency, Line Width

7 PATTERNS AND MODELS

7.1 Pattern Recognition and the Development of Models

Pattern Recognition by Humans; Patterns in Acoustic and Optical Spectra

Can Spectra Mislead? Models and Reality.

7.2 Models for Atomic and Molecular Structure

Box, Harmonic Oscillator, Rotor, Hydrogen Atom

When Models Don't Fit

7.3 From Line Spectra to Black Body Radiation

Effect of Sample Density on Atomic Spectra

Concept of Color Temperature

D. INTERACTION OF ATOMS WITH RADIATION**8 QUANTUM THEORY OF RADIATION**

8.1 Basic View of Radiation

8.2 The Field Regarded as a Quantum System

8.3 The Field as Superposition of Normal Modes; Zero Point energy

8.4 Distribution of Available Energy Among Modes of a Cavity

Monochromatic, Polychromatic, Color Temperature of Broad Non-Thermal Sources

8.5 Models and Abstract Representations for Fields

8.6 When is a Cavity One Dimensional?

8.7 Mode Densities in 1, 2, and 3 Dimensional Cavities

8.8 Concept of Elementary Particle

9 RADIATIVE PROCESSES: ATOMS AND LIGHT

What Happens to Resonant Light as it Passes Through a Dilute Gas?

9.1 The Einstein Description of Radiative Processes

9.2 Natural Lifetime and Spectral Linewidth

9.3 Gain and Loss of Energy in a Beam of Light

9.4 Controlling Output Frequency: Gas Lasers and Dye Lasers

9.5 Ways to Create a Population Inversion

2, 3, and 4 Level Systems

10 SPONTANEOUS EMISSION & MULTIPOLE INTERACTIONS

10.1 Why Excited Atoms Decay

Coupled Oscillator Model for Atom+Field System

Overlap of Field Modes with Atomic Line

10.2 Describing Atom-Field Interaction with Multipoles

E. BASICS FOR A THEORY OF PARTICLE BEHAVIOR**11 EQUATIONS OF MOTION**

11.1 Equations of Motion from Inductive and Deductive Reasoning

Satellite, Oscillator Examples

Equation for Continuous Media: String

Equation for Continuous Media: Electromagnetic Field

11.2 The Schrödinger Equation of Motion

Inductive Approach to a Quantum Equation of Motion

Separation of Variables; Some Properties of State Functions

Sums of Eigenfunctions as Solutions; Need for Complex Functions; Boundary Conditions

12 SOLUTIONS $\Psi(x,t)$ and SUPERPOSITIONS

12.1 Deep Well and its Eigenfunctions

12.2 Superposition States and Time Dependence

Time Evolution of Superposition States with $n=1$ and $n=2$

12.3 Superpositions of Plane Waves: Wave Packets

13 EXPECTATIONS, OBSERVATIONS, and UNCERTAINTIES

13.1 Approximations and Uncertainties

13.2 Expectation Values: General Aspects

When Variables are Discrete

When Variables are Continuous

13.3 Quantum Mechanical Expectation Values

13.4 Observables are Represented by Hermitian Operators

13.5 Expectation Values in Two-State Systems

14 [Expansion Section (not used in this printing of notes)]**F. ONE-DIMENSIONAL SYSTEMS****15 PIECEWISE CONSTANT POTENTIALS: WELLS & BARRIERS**

15.1 Asymmetric Semi-Infinite Square Well:

How many bound states do we have?

15.2 Symmetric Wells of Finite Depth

Always at least one state... when do we have more?

15.3 Effects on Y by Variations in Well Depth:

15.4 Tunneling Phenomena

16 MULTIPLE WELLS IN MOLECULES AND IN SOLIDS16.1 Double Wells: NH_3 and its Energy Levels

16.1.1 States in a Two-Well Potential

16.1.2 NH_3 and its Stark Effect; Beam Maser Operation

16.2 Multiple Wells and Energy Bands in Solids

17 HARMONIC OSCILLATOR: ANALYTIC METHOD

17.0 Linear Restoring Forces and Harmonic Motion in Nature

17.1 Analytic Method

Solving the Equation of Motion; Hermite Polynomials; Raising and Lowering Operations on Polynomials; Harmonic Oscillator Matrix Elements; Induced Correlations and Selection Rules

18. HARMONIC OSCILLATOR: OPERATOR METHOD

18.1 Formulation of the Problem

18.2 Calculation of Dipole Matrix Elements

18.3 on Raising and Lowering Operations

18.4 General Comment on Operator Methods

19 N-STATE APPROXIMATIONS: STATIC & DYNAMIC CASES

19.1 Coherence Effects in Expectation Values

19.1.2 Expectation Values in Coherent N-State Systems

19.1.3 Randomization of Phase and Decay of Coherence

Coherence and Temporal fluctuations; Coherence and Spatial fluctuations

Experimental Observations of Coherence: Dipole Moment of an Aggregate of Atoms

19.1.5 Radiative Decay of Excited States

19.1.6 Aside: The Classical Damped Oscillator

19.2 Two-State, N-state Approximations

19.2.1 On Approximate Solutions to the Schroedinger Equation

19.2.2 The Two-State Approximation

19.2.3 Extension of the Approximation to $N > 2$

19.2.4 Time Dependence in an N-Level System

19.2.5 Time Dependence in a Two-Level System: Rabi Flopping Frequency

G. SOME FORMAL ASPECTS**20 FORMAL ASPECTS OF QUANTUM MECHANICS**

20.1 Expansion of Functions in Eigenstates of Various Operators

Determining Coefficients in a Fourier Expansion

20.2 Relationship of Operators to Observables

Contrasting "Probability Density" and "Expectation Value"

Expectation Value and Operators for Linear Momentum, Kinetic Energy, and Total Energy

20.3 Probability Current

20.4 Matrix Representations of Functions and Operators

The Parallel Between Vectors and Functions

The use of an "Adequate" as opposed to a "Complete" Set

 $L=0,1,2$ Angular Momentum Eigenfunctions as an "Adequate" Set
