Search for H → WW* → lνlν Based on Boosted Decision Trees

Hai-Jun Yang

University of Michigan

LHC Physics Signature Workshop

January 5-11, 2008

Outline

- H$\rightarrow$WW* – a possible early discovery channel
- Brief Introduction of Boosted-Decision-Trees
- H $\rightarrow$ WW* $\rightarrow$ lνlν analysis based on BDT
- ATLAS Sensitivity of H $\rightarrow$ WW* $\rightarrow$ lνlν
- Summary and Outlook

Higgs Production at LHC

➔ Gluon-gluon fusion and WW/ZZ fusion are two dominant Higgs production mechanism.

Higgs Decay Branching Ratio and Discovery Channels

Low mass region: $m(H) < 2 m_Z$
$H \rightarrow \gamma\gamma$
$H \rightarrow b\bar{b}$
$H \rightarrow \tau\tau$
$H \rightarrow ZZ^* \rightarrow 4\ell$
$H \rightarrow WW^* \rightarrow \ell\nu\ell\nu$ or $\ell\nu jj$
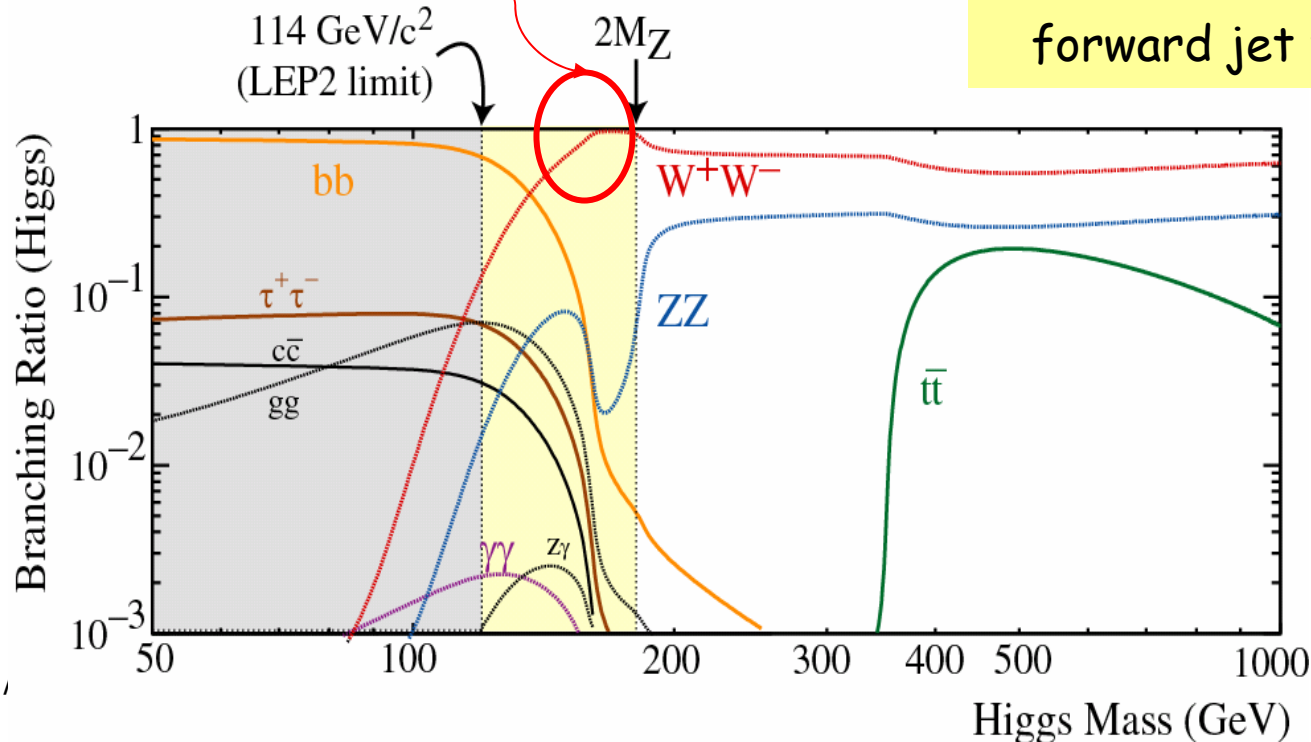

$m(H) > 2 m_Z$
$H \rightarrow ZZ \rightarrow 4\ell$
$qqH \rightarrow ZZ \rightarrow \ell\ell \nu\nu$ *
$qqH \rightarrow ZZ \rightarrow \ell\ell jj$ *
$qqH \rightarrow WW \rightarrow \ell\nu jj$ *
* for $m_H > 300$ GeV
   forward jet tag

114 GeV/c^2 (LEP2 limit)   2M$_Z$

bb
$\tau^+\tau^-$
$c\bar{c}$
gg
$\gamma\gamma$ $z\gamma$
W^+W^-
ZZ
$t\bar{t}$

CMS Phys. TDR 2006

ATLAS Physics 'Commissioning'

- Study the new physics discovery potential with CSC (computing system commissioning) program (started from summer of 2006)

- Physics 'TDR' will be updated soon with ATLAS CSC note using many 10th of Million fully simulated CSC MC data sets and with advanced analysis tools.

- We have developed and applied the BDT technique in diboson physics and Higgs discovery studies with the ATLAS CSC program.

Boosted Decision Trees (BDT)

➔Relative new in HEP – MiniBooNE, BaBar, D0(single top discovery), ATLAS
➔Advantages: robust, understand 'powerful' variables, 'not a black box', …
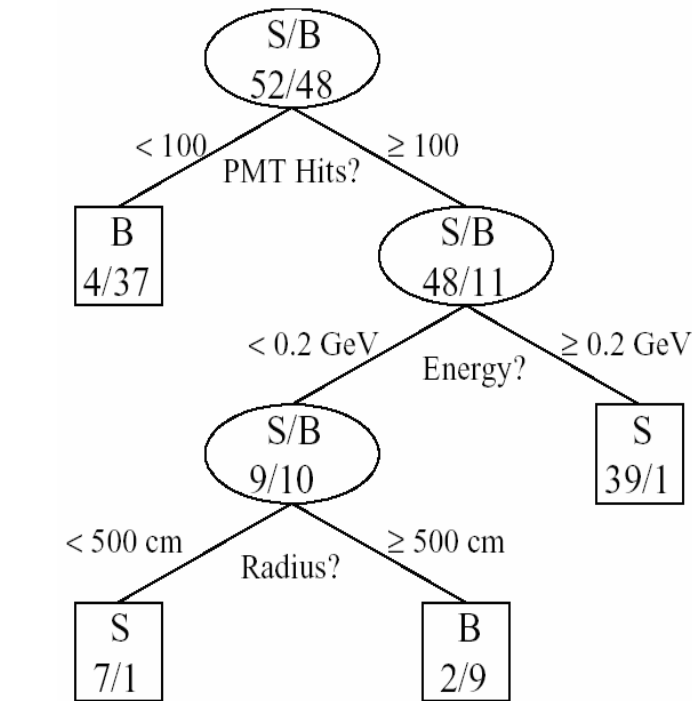

- Split data recursively based on input variables until a stopping criterion is reached (e.g. purity, too few events)

- Every event ends up in a "signal" or a "background" leaf

- Misclassified events will be given larger weight in the next tree (boosting)

- For a given event, if it lands on the signal leaf in one tree, it is given a score of 1, otherwise, -1. The sum of scores from all trees is the final score of the event.

Backgrounds

Process   **MC sample**   **cross-section**

- WW $\rightarrow$ lvlv (l=e,μ,τ)   372.5K,   11.72 pb
- gg2WW $\rightarrow$ lvlv (l=e,μ,τ) 209.1K,   0.54 pb
- ttbar $\rightarrow$ l + X   584.1K,   450.0 pb
- WZ $\rightarrow$ lvll (l=e,μ)   281.4K,   0.7 pb
- Z $\rightarrow$ ll (l=e,μ,τ)   1.15 M,   4.6 nb

- W/Z + Jets are potential background, using 1.1M fully simulated MC events (Alpgen generator), no event is selected in our final sample.

- Background estimate uncertainty ~ 15 – 20 %.

H→ WW Pre-selection

- At least one lepton pair (ee, μμ, eμ) with $P_T > 10$ GeV, $|\eta|<2.5$
- Missing $E_T > 15$ GeV
- $|M_{ee} - M_z| > 10$ GeV, $|M_{\mu\mu} - M_z| > 15$ GeV to suppress background from Z → ee, μμ

Higgs Mass (GeV)	Eff(eeX)	Eff($\mu\mu X$)	Eff($e\mu X$)
140	27.0%	53.9%	39.0%
150	29.2%	54.6%	41.1%
160	30.4%	56.3%	43.2%
165	31.0%	56.8%	43.8%
170	31.1%	55.4%	45.0%
180	29.7%	52.4%	45.8%

- **Staco-muon id**

BDT Training with pre-selected events

Input physics variables to BDT program (1)

- Energy and Momentum

    - $p_T(\ell)$, $p_T(\ell, \ell)$

    - MET, total recoil E_T

    - scalar $\sum E_T(jet)$, vector $\sum E_T(\ell, MET)$

- Lepton Isolation

    - Number of tracks in $\Delta R < 0.4$ cone around ℓ

    - Sum of track p_T in $\Delta R < 0.4$ cone around ℓ
    - Sum of jet E_T in $\Delta R < 0.4$ cone around ℓ

Input physics variables to BDT program (2)

- Event Topology

  - Number of Jets with $E_T > 30$ GeV

  - $E(\ell)/P(\ell)$

  - A0 (impact parameter) of ℓ, $\Delta A0(\ell,\ell)$, $\Delta Z(\ell,\ell)$

  - $\Delta R(\ell,\ell)$, $\Delta\phi(\ell,\ell)$, $\Delta\phi(\ell, MET)$

  - $\Delta\Omega(\ell,\ell)$ - opening angle of two leptons

- Mass Information

  - Invariant mass(ℓ,ℓ)

 - Transverse mass$(\ell\ell,\text{MET})$

  - Transverse mass(ℓ,MET)

H → WW* → lνlν
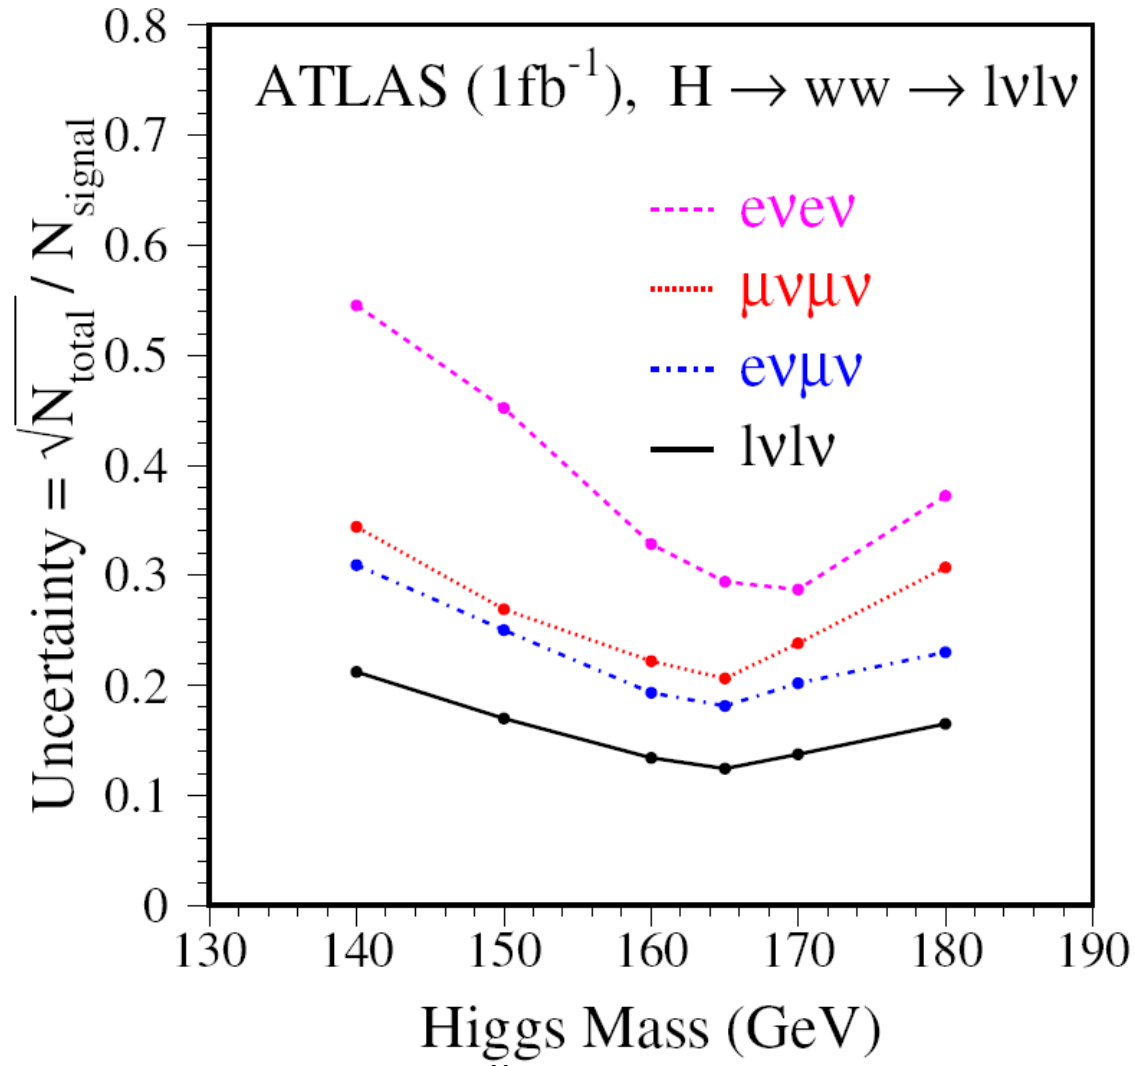

# Summary and Outlook

- H $\to$ WW* $\to$ lνlν analysis based on BDT has significant impact on early discovery potential.

- For 140-180 GeV SM Higgs 5σ discovery only needs a few fb^{-1} integrated luminosity.

- Major backgrounds for H $\to$ WW searches come from WW(50-60%) and ttbar(30-40%).

$\to$ BDT is anticipated to have wide application in LHC physics analysis, especially for particle searches.

H→WW*→eνeν (165 GeV)
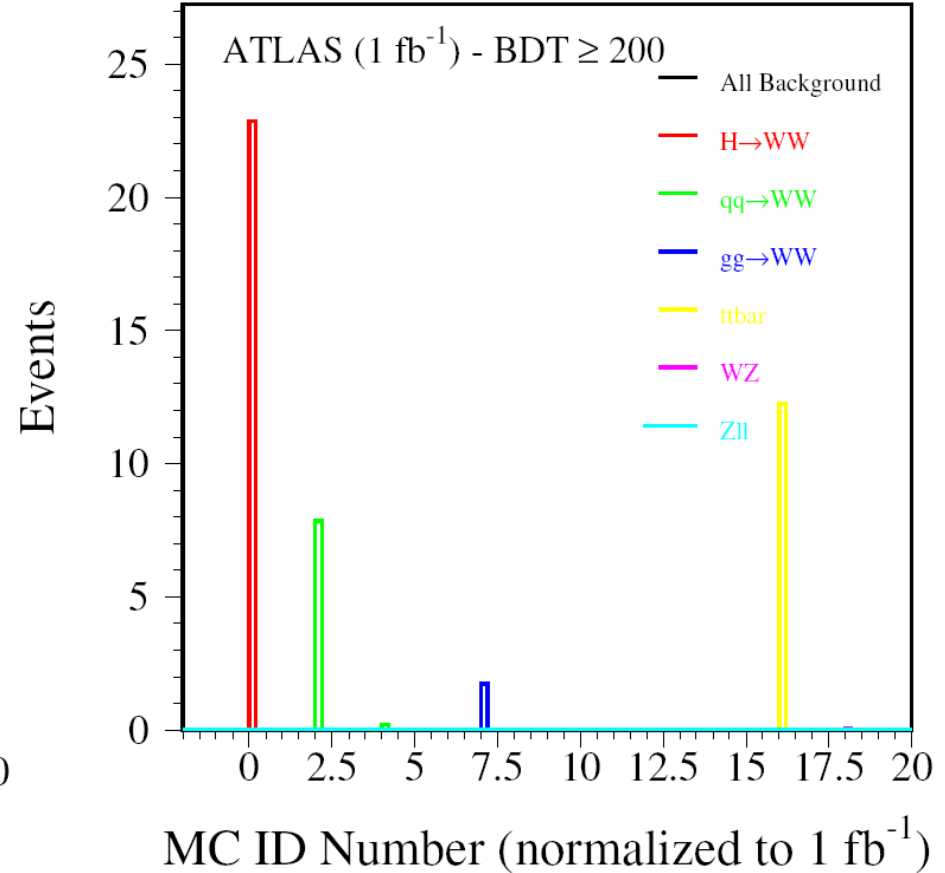

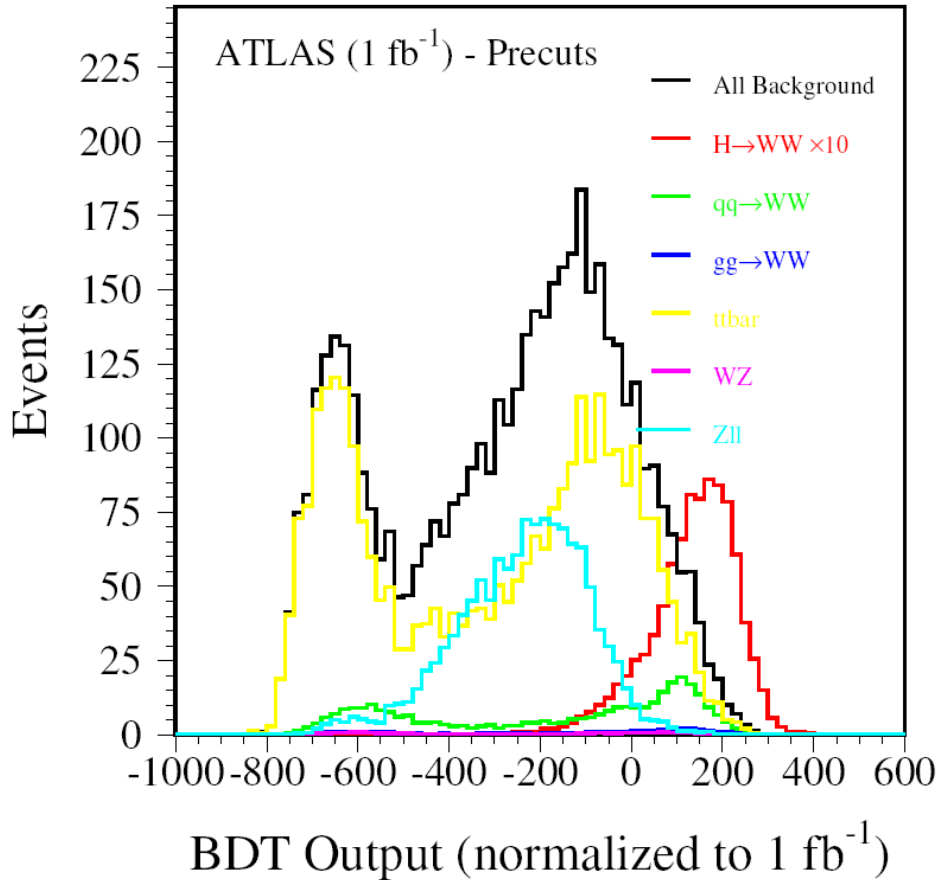

H→WW*→μνμν (165 GeV)
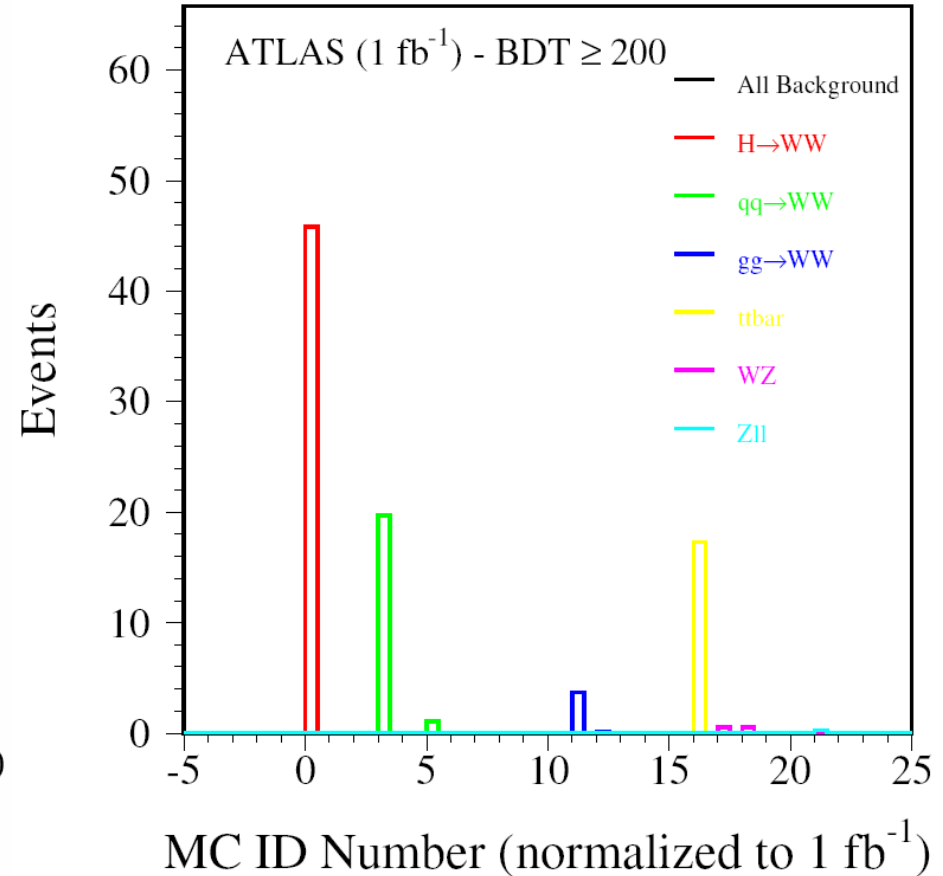

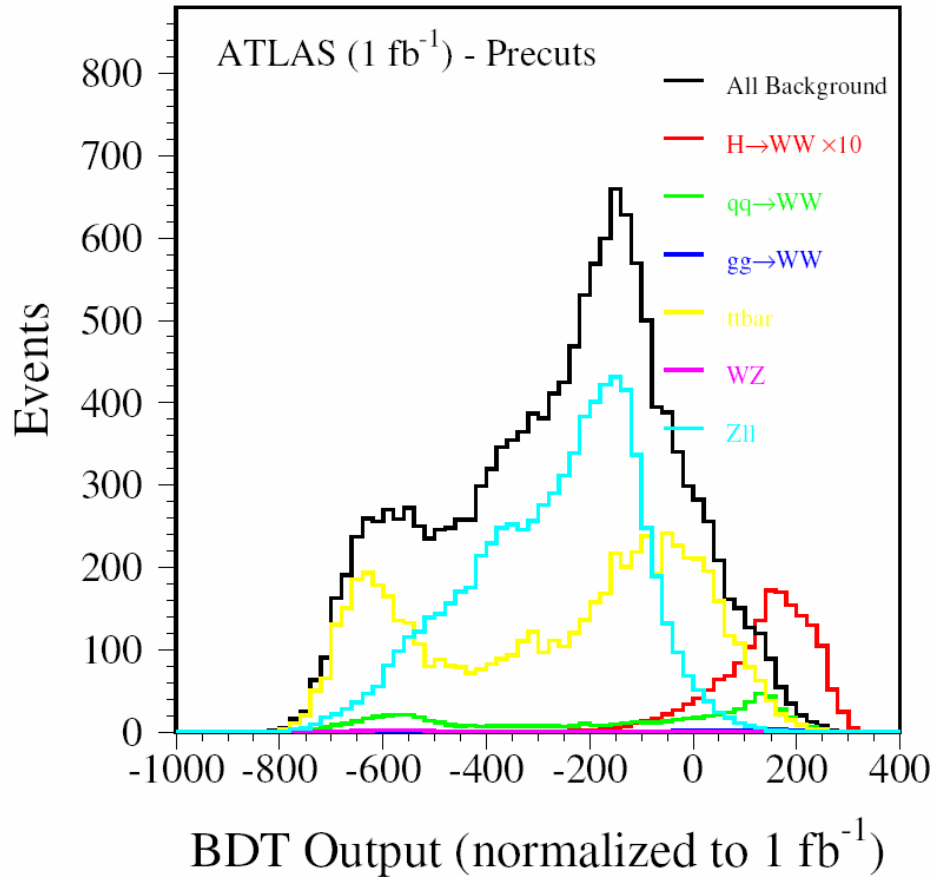

Weak → Powerful Classifier

➔ Boosted decision trees focus on the misclassified events which usually have high weights after hundreds of tree iterations. An individual tree has a very weak discriminating power; the weighted misclassified event rate err_m is about 0.4-0.45.

➔ The advantage of using boosted decision trees is that it combines many decision trees, "weak" classifiers, to make a powerful classifier. The performance of boosted decision trees is stable after a few hundred tree iterations.

BDT Training with Event Reweighting

- In the original BDT training program, all training events are set to have same weights in the beginning (the first tree). It works fine if all MC processes are produced based on their production rates.

- Our MCs are produced separately, the event weights vary from various backgrounds. e.g. 1 fb^{-1} ,wt (ww)=0.07, wt (ttbar)=0.72

- If we treat all training events with different weights equally using "standard" training algorithm, ANN/BDT tend to pay more attention to events with lower weights (high stat.) and introduce training prejudice.
